

Truck on Fire

Introduction

Delivering items ordered on our platform consists of various steps. One of these steps is transporting the ordered items on a truck. Everything does not always go according to plan, and sometimes one of the trucks might break down. To ensure timely delivery to our customers, it is necessary to transfer the items to another truck. The challenge in the interview is to write/change some code to streamline this process so that the items can be delivered to the customers on time.

Requirements:

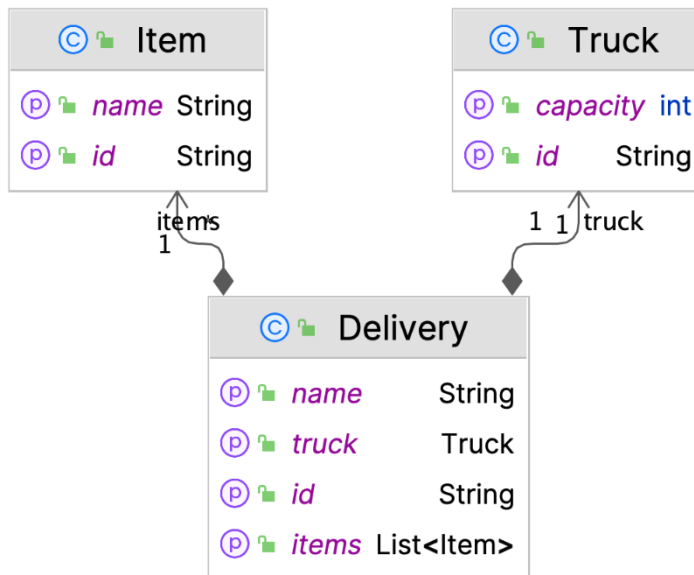

Please have this setup on your machine ready, before the interview starts:

- One of the following:
 - Java 21

- Kotlin 1.9
- GIT 2.x
- IDE of preference

Entity Relation Diagram:

You will receive some code before the interview starts. The model below will be implemented already. You will then be tasked to solve some problems using the implementation of this model.

Interview process:

You will be joining us online via Teams, pair programming with a couple of Bol software engineers. You will be sharing your screen while solving some coding problems. The interview process consists of a few iterations. The interview should take about 2 hours including some breaks. In the beginning of the interview, you can choose whether to solve the assignment in Java or Kotlin.

Tips

- You can use Google on your shared screen. You cannot use any AI tools like ChatGPT, Gemini, etc. Note: you are also not allowed to use any AI plugins/ copilots in your IDE
- We expect completeness, but do not overthink the problem.
- Each iteration of the interview has many steps, and each one depends on the previous step, so we recommend you to first make each step work and refine it later if needed. Consider it an MVP that will be growing.
- Keep in mind, your thought process is just as important as a complete solution. Try to explain what you are doing.
- Do not be afraid to ask clarifying questions – the interviewers are here to help.
- Be yourself and have fun!
